

A low-angle, upward-looking photograph of a wind turbine. The tower is a thick, white cylindrical structure that dominates the lower right portion of the frame. At the top of the tower, the nacelle is visible, with three long, white blades extending outwards. The background is a clear, vibrant blue sky, with a bright sun in the upper right corner creating a large, multi-colored lens flare that radiates across the sky. The overall mood is bright and clean, representing renewable energy.

Wind Energy - 101 Educators Workshop

The Kidwind Project
www.kidwind.org

jon@oregonrenewables.com

What is KidWind?

The KidWind Project is a team of teachers, students, engineers, and practitioners exploring the science behind wind and other renewable forms of energy. Our goal is to make renewable energy widely accessible through hands-on activities which are challenging, engaging and teach basic science and engineering principles.

“Engaging minds for a responsible future...”

Why Renewable Energy & Efficiency?

Humanity's Top Ten Problems for next 50 years

1. **ENERGY**
2. Water
3. Food
4. Environment
5. Poverty
6. Terrorism & War
7. Disease
8. **EDUCATION**
9. Democracy
10. Population

Science Literacy

- In the U.S., anthropogenic climate change is still a “debate”
- Recent studies have shown that 50% of Americans cannot name an example of *renewable energy*.
- 8% of Americans can pass basic energy literacy test
- How can we “conserve” energy if we don’t understand basic energy concepts?

Why Clean Energy Science in K-12 ?

- Students learn science/math **standards**
 - Lessons are completely scalable from elementary through college level
- Addresses **myths and misconceptions** regarding renewable energy
- Encourages higher interest in Science and Math
 - Science/Math activities with “larger **social purpose**”
- Students learn about **jobs/careers** in renewable energy industry, as well as opportunities for **further training**
- Educate the next generation of leaders and decision makers to make more informed choices

Where is the Wind Power?

Current Installed Wind Power Capacity (MW)

Total: 51,630 MW
(As of 09/30/2012)

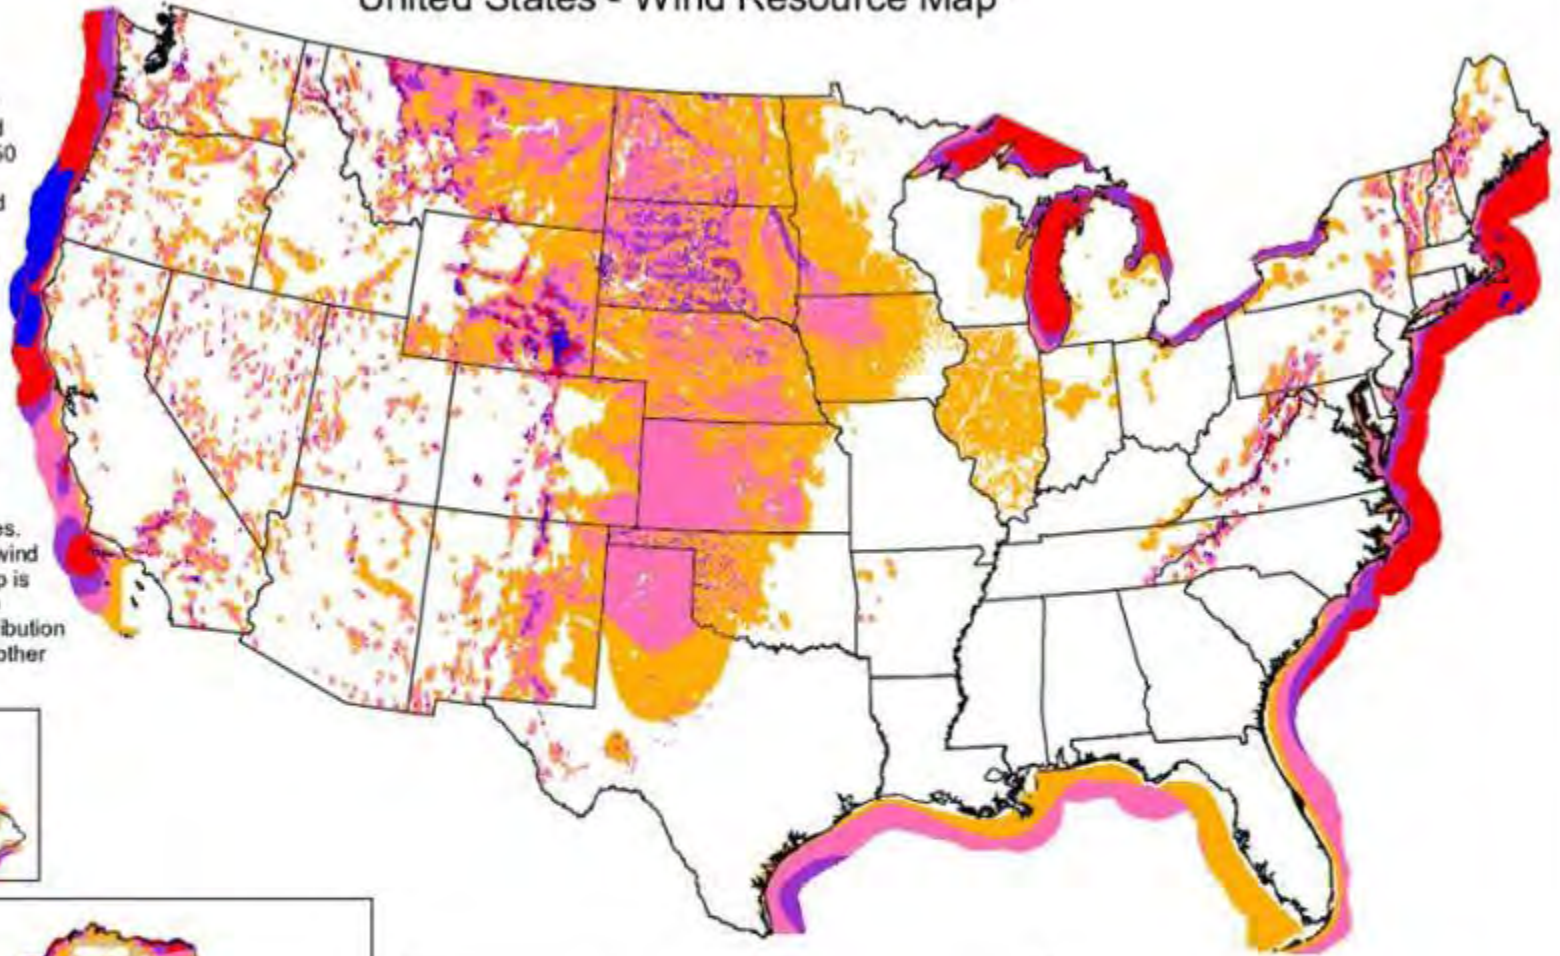

Data is from the American Wind Energy Association Third Quarter 2012 Market Report: <http://www.awea.org>

U.S. Department of Energy

United States - Wind Resource Map

This map shows the annual average wind power estimates at 50 meters above the surface of the United States. It is a combination of high resolution and low resolution datasets produced by NREL and other organizations. The data was screened to eliminate areas unlikely to be developed onshore due to land use or environmental issues. In many states, the wind resource on this map is visually enhanced to better show the distribution on ridge crests and other features.

Wind Power Classification

Wind Power Class	Resource Potential	Wind Power Density at 50 m W/m ²	Wind Speed ^a at 50 m m/s	Wind Speed ^a at 50 m mph
3	Fair	300 - 400	6.4 - 7.0	14.3 - 15.7
4	Good	400 - 500	7.0 - 7.5	15.7 - 16.8
5	Excellent	500 - 600	7.5 - 8.0	16.8 - 17.9
6	Outstanding	600 - 800	8.0 - 8.8	17.9 - 19.7
7	Superb	800 - 1600	8.8 - 11.1	19.7 - 24.8

Smith-Putnam Turbine

Vermont, 1940's

1.25 MW

Modern Windmills

Rotor Orientation

Vertical Axis Turbines

Advantages

- Components can be mounted at ground level
 - Ease of service
 - Lighter weight towers
- Can theoretically use less materials to capture the same amount of wind

Disadvantages

- Rotors generally near ground where wind is poorer
- Centrifugal force stresses blades
- Poor self-starting capabilities
- Requires support at top of turbine rotor
- Requires entire rotor to be removed to replace bearings
- $\frac{1}{2}$ of rotor travels upwind
- Have never been commercially successful
- Cost per kilowatt-hour
- Overall poor performance and reliability

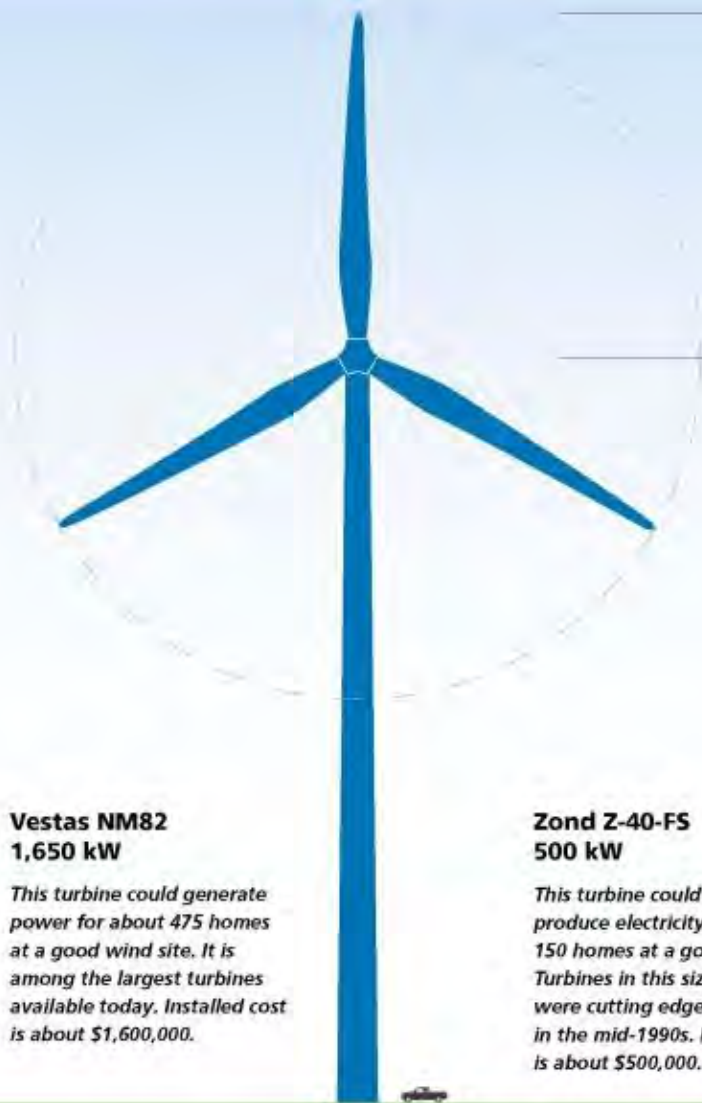

Horizontal Axis Wind Turbines

- Rotors are usually Up-wind of tower
- Some machines have down-wind rotors, but only commercially available ones are small turbines
- Proven, viable technology

THE SCALE OF WIND POWER

397'

262'

Vestas NM82
1,650 kW

This turbine could generate power for about 475 homes at a good wind site. It is among the largest turbines available today. Installed cost is about \$1,600,000.

Zond Z-40-FS
500 kW

This turbine could produce electricity for about 150 homes at a good wind site. Turbines in this size range were cutting edge technology in the mid-1990s. Installed cost is about \$500,000.

198'

132'

Bergey Excel 10kW

At a good wind site, this turbine could generate enough electricity for one average household. Installed cost is about \$35,000.

112'

100'

Wacky Designs out there...

Great for learning,
hypothesizing, testing,
and creative exploration

Small Wind

Industrial Wind

Community Wind

Distributed Generation

Central Generation

Distributed Generation

Distributed statewide
 - Good for grid reliability

Local energy
 - Reduces transmission
 - Uses what is available

Energy in YOUR community
 - Benefits should stay in YOUR community

Large Wind Turbines

Wind turbine components

Turbine Components

A	Blades
B	Hub
C	Nacelle
D	Tower

Over-Speed Protection

Blade Pitch Regulation

- Modern industrial scale turbines are shut down at wind speeds of 25 m/s (55 mph).
- This is done by pitching the blades flat so the rotor will not turn.
- A mechanical brake can also be applied to the driveshaft.

Maintenance

Crop of the 21ST Century

Off-Shore Wind Farms

Deep Water Wind Turbine Development

A wide-angle photograph of a lush green field of grass, likely a prairie or steppe, blowing in the wind. The grass is vibrant green and has a dynamic, flowing appearance. The horizon is flat and extends across the middle of the frame. The sky is filled with soft, white and grey clouds, with a hint of blue at the top. The overall scene conveys a sense of natural energy and movement.

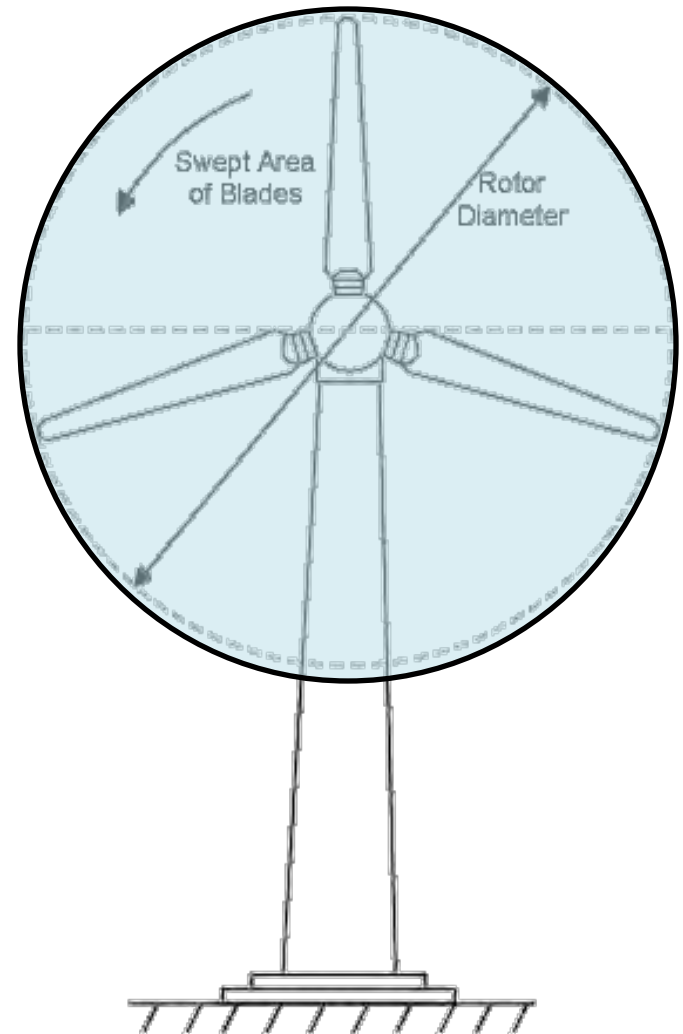

Importance of the WIND RESOURCE

Site Assessment Rule #1

*Keep in mind what
we're after...*

Power in the wind

- Air density, ρ
- Swept area, A
- Wind speed, V

Calculating Power in the Wind

$$\text{Power} = \frac{1}{2} \rho$$

–Air density, ρ

We can't do much about
this...density is what it is.

Calculating Power in the Wind

$$\text{Power} = \frac{1}{2} \rho A$$

–Air density, ρ

–Swept area, A

We could select a
bigger rotor...

Calculating Power in the Wind

$$\text{Power} = \frac{1}{2} \rho A x V$$

–Air density, ρ

–Swept area, A

–Wind speed, V ...

Calculating Power in the Wind

$$\text{Power} = \frac{1}{2} \rho A v^3$$

– Air density, ρ

– Swept area, A

– Wind speed, v ...

Calculating Power in the Wind

$$\text{Power} = \frac{1}{2} \rho A v^3$$

–Air density, ρ

–Swept area, A

–Wind speed, v

Calculating Power in the Wind

$$\text{Power} = \frac{1}{2} \rho AV^3$$

- Air density, ρ
- Swept area, A
- Wind speed, V

Q: How do we get a higher wind speed?

More Tower, More Power

Why do wind speeds climb with elevation??

...Think of a comparison to flowing water

Turbulent wind is bad wind

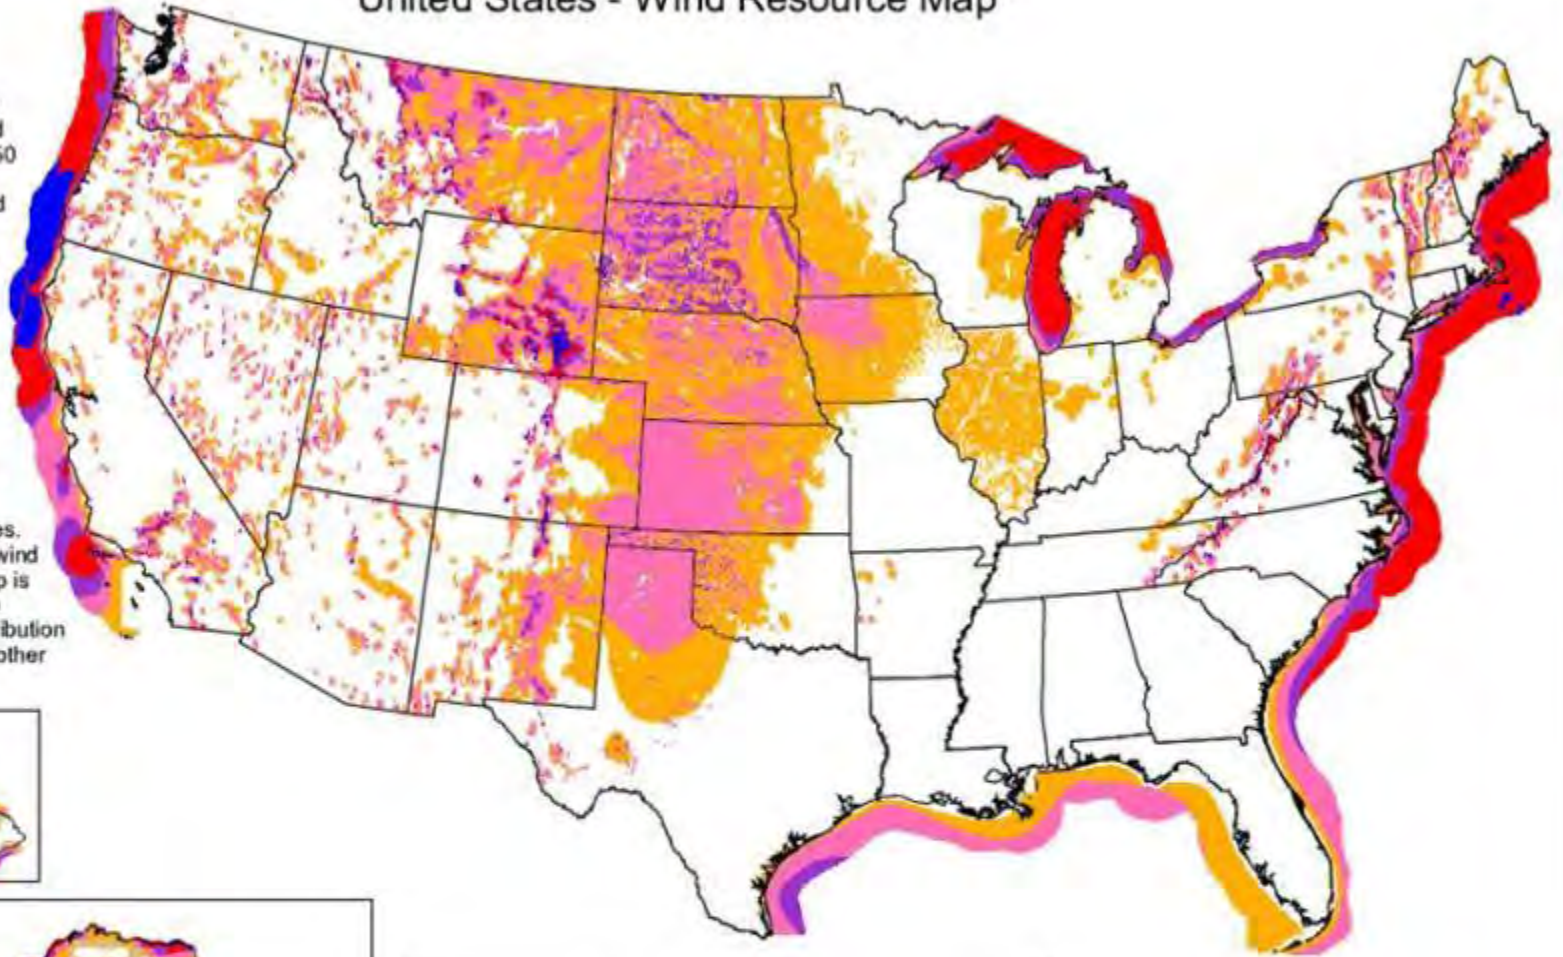

Again...think of a comparison to water

WindWise!

WindWise is a partnership of the KidWind Project and Normandeau Associates. Try our innovative curriculum and teacher training program for 6-12 grades that provides answers to today's real world energy questions.

Get Started

WHICH BLADES ARE BEST?

KEY CONCEPT
Students will learn through experimentation that different blade designs will result in different amounts of energy being captured by the wind.

BACKGROUND

The blades of a wind turbine have the most important job of all: to capture energy. Over time, engineers have experimented with many different shapes, designs, materials, and numbers of blades to find what would best. The best answer has always depended on the speed of the wind.

OBJECTIVES

- At the end of the lesson, students will:
 - Know the process of scientific inquiry to test their design variables.
 - Be able to collect, analyze, and present data in a meaningful way.
 - Design a test.
 - Understand the engineering design process.
 - Understand how wind turbine is connected to electricity.

METHOD

Students will use their science skills to test different variables to design and measure the power output of their. Each group of students will create two models of wind turbine blades. They will test and present data to their teacher. If time allows, students can use their collected data to design an optimal set of wind turbine blades using the same design. (Note: Use 1 Design a Better Blade?)

MATERIALS

- You will need one set of the following materials for each group:
- 1 model turbine (see last activity) (optional)
 - 1 fan (on)
 - 1 fan (off)
 - 100 pennies, Post-its, or paper (small) (optional)
 - Blades
 - Percent of wind turbine blades (see the Wind Change Worksheet above)
 - Additional Resources
 - Sample Models of varying sizes, shapes, and materials
 - One pencil (optional), paper, construction paper (optional)
 - 10 sheets of paper
 - Scissors
 - Protractor for measuring blade angle
 - Blade glider
 - Protractor (for graph paper) (optional)
 - Student Worksheet

TIME REQUIRED

1-2 class periods

Research Topics for Students

- Turbine research – Improvements to design, efficiency, and cost controls.
- Wind resource assessment – Wind data and its variability.
- Forecasting – Weather models, predicting wind behaviors.
- Utility grid integration – Grid management and technologies.
- Energy storage – Storage and conversion.

Questions???

The KidWind Project
www.kidwind.org

jon@oregonrenewables.com

How Does A Windmill Work?

WindWise Lesson 8

- Know the fundamental parts of a windmill
- Be able to use the scientific method to isolate and adjust variables in a model windmill
- Understand energy conversion/transfers and how a windmill converts moving air into mechanical energy

Which Blades Are Best?

WindWise Lesson 10

- Understand how wind energy is converted to electricity
- Know the process of scientific inquiry to test blade design variables
- Be able to collect, evaluate, and present data to determine which blade design is best
- Understand the engineering design process

Key Concepts

How do windmills spin?

- Force of the wind
 - Deflection
 - Equal & opposite reaction

Rotor

Wind Speed – Power in the Wind

Torque (turning force)

- a.k.a. leverage

Driveshaft

- Pulley ratio (simple machines)
- Friction

Rotor Variables

- Blade pitch
- Blade shape
- Blade size
- # of blades
- Solidity

Extensions

(Advanced Concepts)

ENERGY (J) = Mass (kg) x Acceleration of Gravity (9.8 m/s²) x Height (m)

POWER (W) = Energy (J) / Time (s)

Economics: Each item you use has a dollar value attributed to it. What was the cost of your windmill? Cost of energy?
